# ICM7211AM

## 4-Digit, LCD Display Driver

The ICM7211AM device is a non-multiplexed four-digit seven-segment CMOS LCD display decoder-driver.

This device is configured to drive conventional LCD displays by providing a complete RC oscillator, divider chain, backplane driver, and 28 segment outputs.

It also has a microprocessor compatible input configuration, which provides data input latches and Digit Address latches under control of high-speed Chip Select inputs. These devices simplify the task of implementing a cost-effective alphanumeric seven-segment display for microprocessor systems, without requiring extensive ROM or CPU time for decoding and display updating.

The ICM7211AM provides the "Code B" output code, i.e., 0-9, dash, E, H, L, P, blank, but will correctly decode true BCD to seven-segment decimal outputs.

## Features

- Four Digit Non-Multiplexed 7 Segment LCD Display Outputs with Backplane Driver

- Complete Onboard RC Oscillator to Generate Backplane Frequency

- Backplane Input/Output Allows Simple Synchronization of Slave-Devices to a Master

- Provides Data and Digit Address Latches Controlled by Chip Select Inputs to Provide a Direct High Speed Processor Interface

- Decodes Binary to Code B (0-9, Dash, E, H, L, P, Blank)
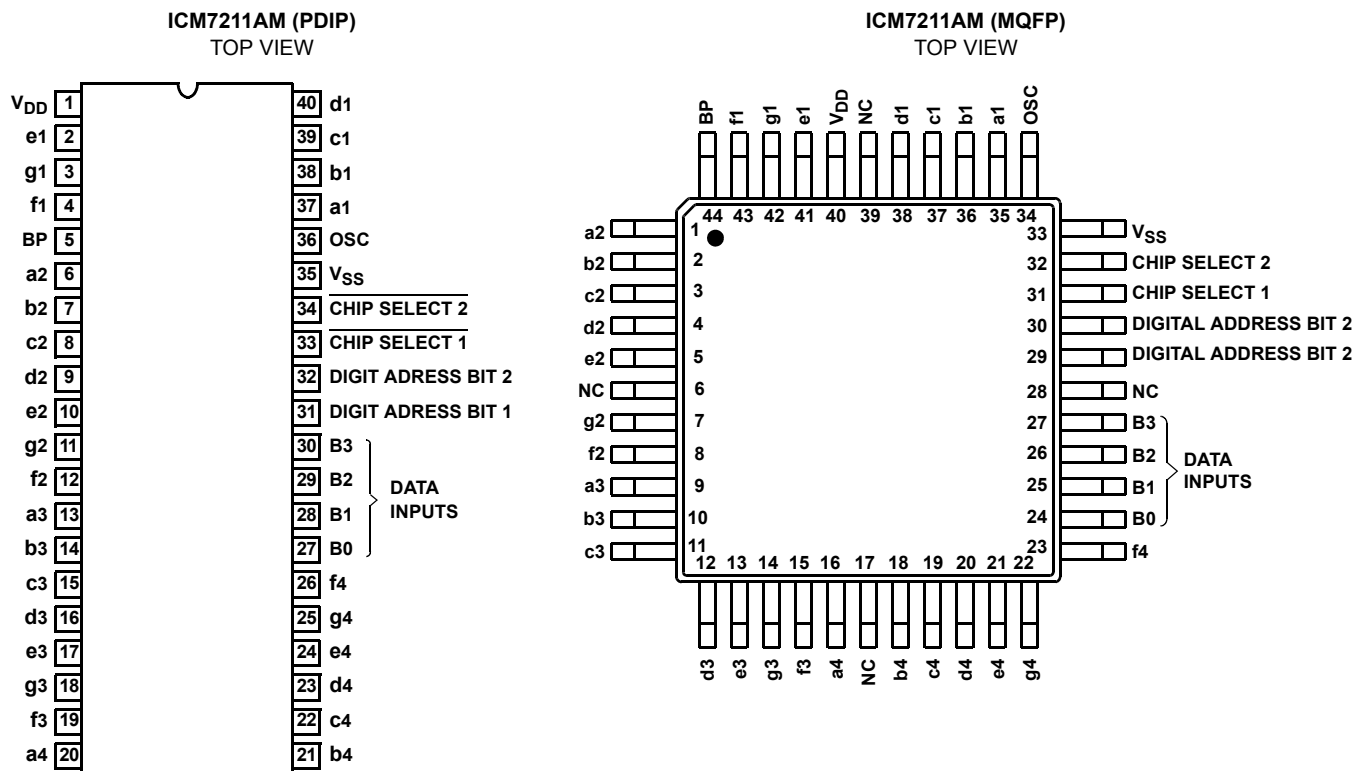

- Pb-Free Plus Anneal Available (RoHS Compliant)

## Ordering Information

| PART NUMBER | PART MARKING | DISPLAY TYPE | DISPLAY DECODING | INPUT INTERFACING | DISPLAY DRIVE TYPE | TEMP. RANGE (°C) | PACKAGE | PKG. DWG. # |

| ICM7211AMIM44 | ICM7211AMIM44 | LCD | Code B | Microprocessor | Direct Drive | -40 to 85 | 44 Ld MQFP | Q44.10x10 |
| ICM7211AMIPL **(No longer available, recommended replacement: ICM7211AMIPLZ)** | ICM7211AMIPL | LCD | Code B | Microprocessor | Direct Drive | -40 to 85 | 40 Ld PDIP | E40.6 |
| ICM7211AMIPLZ (Note) | ICM7211AMIPLZ | LCD | Code B | Microprocessor | Direct Drive | -40 to 85 | 40 Ld PDIP* (Pb-free) | E40.6 |

NOTE: Intersil Pb-free plus anneal products employ special Pb-free material sets; molding compounds/die attach materials and 100% matte tin plate termination finish, which are RoHS compliant and compatible with both SnPb and Pb-free soldering operations. Intersil Pb-free products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb-free requirements of IPC/JEDEC J STD-020.

*Pb-free PDIPs can be used for through hole wave solder processing only. They are not intended for use in Reflow solder processing applications.

*Pb-free PDIPs can be used for through hole wave solder process-ing only. They are not intended for use in Reflow solder processing applications.

*CAUTION: Stresses above those listed in "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress only rating and operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied.*

NOTES:

1. Due to the SCR structure inherent in the CMOS process, connecting any terminal to voltages greater than $V_{DD}$ or less than $V_{SS}$ may cause destructive device latchup. For this reason, it is recommended that no inputs from external sources not operating on the same power supply be applied to the device before its supply is established, and that in multiple supply systems, the supply to the ICM7211AM be turned on first.

2. $\theta_{JA}$ is measured with the component mounted on an evaluation PC board in free air.

FIGURE 3. BACKPLANE FREQUENCY AS A FUNCTION OF SUPPLY VOLTAGE

## Description of Operation

### Device

The ICM7211AM provides outputs suitable for driving conventional four-digit, seven-segment LCD displays. These devices include 28 individual segment drivers, backplane driver, and a self-contained oscillator and divider chain to generate the backplane frequency.

The segment and backplane drivers each consist of a CMOS inverter, with the N-Channel and P-Channel devices ratioed to provide identical on resistances, and thus equal rise and fall times. This eliminates any DC component, which could arise from differing rise and fall times, and ensures maximum display life.

The backplane output devices can be disabled by connecting the OSCillator input (pin 36) to $V_{SS}$. This allows the 28 segment outputs to be synchronized directly to a signal input at the BP terminal (pin 5). In this manner, several slave devices may be cascaded to the backplane output of one master device, or the backplane may be derived from an external source. This allows the use of displays with characters in multiples of four and a single backplane. A slave device represents a load of approximately 200pF (comparable to one additional segment). Thus the limitation of the number of devices that can be slaved to one master device backplane driver is the additional load represented by the larger backplane of displays of more than four digits. A good rule of thumb to observe in order to minimize power consumption is to keep the backplane rise and fall times less than about 5µs. The backplane output driver should handle the backplane to a display of 16 one-half inch characters. It is recommended, if more than four devices are to be slaved together, the backplane signal be derived externally and all the ICM7211AM devices be slaved to it. This external signal should be capable of driving very large capacitive loads with short (1 - 2µs) rise and fall times. The maximum frequency for a backplane signal should be about 150Hz although this may be too fast for optimum display response at lower display temperatures, depending on the display type.

The onboard oscillator is designed to free run at approximately 19kHz at microampere current levels. The oscillator frequency is divided by 128 to provide the backplane frequency, which will be approximately 150Hz with the oscillator free-running; the oscillator frequency may be reduced by connecting an external capacitor between the OSCillator terminal and $V_{DD}$.

The oscillator may also be overdriven if desired, although care must be taken to ensure that the backplane driver is not disabled during the negative portion of the overdriving signal (which could cause a DC component to the display). This can be done by driving the OSCillator input between the positive supply and a level out of the range where the backplane disable is sensed (about one fifth of the supply voltage above $V_{SS}$).

Another technique for overdriving the oscillator (with a signal swinging the full supply) is to skew the duty cycle of the overdriving signal such that the negative portion has a duration shorter than about one microsecond. The backplane disable sensing circuit will not respond to signals of this duration.

FIGURE 4. DISPLAY WAVEFORMS

### Input Configurations and Output Codes

The ICM7211AM accepts a four-bit true binary (i.e., positive level = logical one) input at pins 27 thru 30, least significant bit at pin 27 ascending to the most significant bit at pin 30. It decodes the binary input into seven-segment alphanumeric "Code B" output, i.e., 0-9, dash, E, H, L, P, blank. These codes are shown explicitly in Table 1. It will correctly decode true BCD to a seven-segment decimal output.

TABLE 1. OUTPUT CODES

| BINARY | | | | CODE B ICM7211AM |
|---|---|---|---|---|
| B3 | B2 | B1 | BO | |
| 0 | 0 | 0 | 0 | 0 |
| 0 | 0 | 0 | 1 | 1 |
| 0 | 0 | 1 | 0 | 2 |
| 0 | 0 | 1 | 1 | 3 |
| 0 | 1 | 0 | 0 | 4 |
| 0 | 1 | 0 | 1 | 5 |
| 0 | 1 | 1 | 0 | 6 |
| 0 | 1 | 1 | 1 | 7 |
| 1 | 0 | 0 | 0 | 8 |
| 1 | 0 | 0 | 1 | 9 |
| 1 | 0 | 1 | 0 | − |
| 1 | 0 | 1 | 1 | E |

**TABLE 1. OUTPUT CODES (Continued)**

| BINARY | | | | CODE B |
|---|---|---|---|---|
| B3 | B2 | B1 | BO | ICM7211AM |
| 1 | 1 | 0 | 0 | $H$ |
| 1 | 1 | 0 | 1 | $L$ |
| 1 | 1 | 1 | 0 | $P$ |
| 1 | 1 | 1 | 1 | BLANK |

The ICM7211AM is intended to accept data from a data bus under processor control.

In these devices, the four data input bits and the two-bit digit address (DA1 pin 31, DA2 pin 32) are written into input buffer latches when both chip select inputs ($\overline{CS1}$ pin 33, $\overline{CS2}$ pin 34) are taken low. On the rising edge of either chip select input, the content of the data input latches is decoded and stored in the output latches of the digit selected by the contents of the digit address latches.

An address of 00 writes into D4, DA2 = 0, DA1 = 1 writes into D3, DA2 = 1, DA1 = 0 writes into D2, and 11 writes into D1. The timing relationships for inputting data are shown in Figure 1, and the chip select pulse widths and data setup and hold times are specified under Operating Characteristics.

## About Intersil

Intersil Corporation is a leading provider of innovative power management and precision analog solutions. The company's products address some of the largest markets within the industrial and infrastructure, mobile computing and high-end consumer markets.

For the most updated datasheet, application notes, related documentation and related parts, please see the respective product information page found at www.intersil.com.

You may report errors or suggestions for improving this datasheet by visiting www.intersil.com/ask.

Reliability reports are also available from our website at www.intersil.com/support.

For additional products, see www.intersil.com/en/products.html

Intersil products are manufactured, assembled and tested utilizing ISO9001 quality systems as noted in the quality certifications found at www.intersil.com/en/support/qualandreliability.html

Intersil products are sold by description only. Intersil may modify the circuit design and/or specifications of products at any time without notice, provided that such modification does not, in Intersil's sole judgment, affect the form, fit or function of the product. Accordingly, the reader is cautioned to verify that datasheets are current before placing orders. Information furnished by Intersil is believed to be accurate and reliable. However, no responsibility is assumed by Intersil or its subsidiaries for its use; nor for any infringements of patents or other rights of third parties which may result from its use. No license is granted by implication or otherwise under any patent or patent rights of Intersil or its subsidiaries.
