

TPS65218D0 Power Management for ARM® Cortex™-A8/A9 SOCs and FPGAs

1 Device Overview

1.1 Features

- Three Adjustable Step-Down Converters With Integrated Switching FETs (DCDC1, DCDC2, DCDC3):
 - DCDC1: 1.1-V Default, up to 1.8 A
 - DCDC2: 1.1-V Default, up to 1.8 A
 - DCDC3: 1.2-V Default, up to 1.8 A
 - VIN Range From 2.7 V to 5.5 V
 - Adjustable Output Voltage Range 0.85 V to 1.675 V (DCDC1 and DCDC2)
 - Adjustable Output Voltage Range 0.9 V to 3.4 V (DCDC3)
 - Power Save Mode at Light Load Current
 - 100% Duty Cycle for Lowest Dropout
 - Active Output-Discharge When Disabled
- One Adjustable Buck-Boost Converter With Integrated Switching FETs (DCDC4):
 - DCDC4: 3.3 V Default, up to 1.6 A
 - VIN Range From 2.7 V to 5.5 V
 - Adjustable Output Voltage Range 1.175 V to 3.4 V
 - Active Output-Discharge When Disabled
- Two Low-Quiescent Current, High Efficiency Step-Down Converters for Battery Backup Domain (DCDC5, DCDC6)
 - DCDC5: 1-V Output
 - DCDC6: 1.8-V Output
 - VIN Range from 2.2 V to 5.5 V
 - Supplied From System Power or Coin-Cell Backup Battery
- Adjustable General-Purpose LDO (LDO1)
 - LDO1: 1.8-V Default up to 400 mA
 - VIN Range From 1.8 V to 5.5 V
 - Adjustable Output Voltage Range From 0.9 V to 3.4 V
 - Active Output-Discharge When Disabled
- Low-Voltage Load Switch (LS1) With 350-mA Current Limit
 - VIN Range From 1.2 V to 3.6 V
 - 110-mΩ (Max) Switch Impedance at 1.35 V
- 5-V Load Switch (LS2) With 100-mA or 500-mA Selectable Current Limit
 - VIN Range From 3 V to 5.5 V
 - 500-mΩ (Max) Switch Impedance at 5 V
- High-Voltage Load Switch (LS3) With 100-mA or 500-mA Selectable Current Limit
 - VIN Range From 1.8 V to 10 V
 - 500-mΩ (Max) Switch Impedance
- Supervisor With Built-in Supervisor Function Monitors
 - DCDC1, DCDC2 ±4% Tolerance
 - DCDC3, DCDC4 ±5% Tolerance
 - LDO1 ±5% Tolerance
- Protection, Diagnostics, and Control:
 - Undervoltage Lockout (UVLO)
 - Always-on Push-Button Monitor
 - Overtemperature Warning and Shutdown
 - Separate Power-Good Output for Backup and Main Supplies
 - I²C Interface (Address 0x24) (See [Timing Requirements](#) for I²C Operation at 400 kHz)

1.2 Applications

- Industrial Automation
- Electronic Point of Sale (ePOS)
- Test and Measurement
- Personal Navigation
- Industrial Communications
- Backplane I/O
- Connected Industrial Drives

1.3 Description

The TPS65218D0 is a single chip, power-management IC (PMIC) specifically designed to support the AM335x and AM438x line of processors in both portable (Li-Ion battery) and nonportable (5-V adapter) applications. The device is characterized across a –40°C to +105°C temperature range, making it suitable for various industrial applications.

The TPS65218D0 is specifically designed to provide power management for all the functionalities of the AM438x processor. The DC/DC converters DCDC1 through DCDC4 are intended to power the core, MPU, DDR memory, and 3.3-V analog and I/O, respectively. LDO1 provides the 1.8-V analog and I/O for the processor. GPIO1 and GPO2 allow for memory reset and GPIO3 allows for warm reset (335x only) of the DCDC1 and DCDC2 converters. The I²C interface allows the user to enable and disable all voltage regulators, load switches, and GPIOs. Additionally, UVLO and supervisor voltage thresholds, power-up sequence, and power-down sequence can be programmed through I²C. Interrupts for overtemperature, overcurrent, and undervoltage can be monitored as well. The supervisor monitors DCDC1 through DCDC4 and LDO1. The supervisor has two settings, one for typical undervoltage tolerance (STRICT = 0b), and one for tight undervoltage and overvoltage tolerances (STRICT = 1b). A power-good signal indicates proper regulation of the five voltage regulators.

Three hysteretic step-down converters are targeted at providing power for the processor core, MPU, and DDRx memory. The default output voltages for each converter can be adjusted through the I²C interface. DCDC1 and DCDC2 feature dynamic voltage scaling to provide power at all operating points of the processor. DCDC1 and DCDC2 also have programmable slew rates to help protect processor components. DCDC3 remains powered while the processor is in a sleep mode to maintain power to DDRx memory. Backup power provides two step-down converters for the tamper, RTC, or both domains of the processor if system power fails or is disabled. If both system power and coin-cell battery are connected to the PMIC, power is not drawn from the coin-cell battery. A separate power good signal monitors the backup converters. A battery backup monitor determines the power level of the coin-cell battery.

The TPS65218D0 device is available in a 48-pin VQFN package (6 mm × 6 mm, 0.4-mm pitch).

Device Information⁽¹⁾

PART NUMBER	PACKAGE	BODY SIZE (NOM)
TPS65218D0	VQFN (48) ⁽²⁾	6.00 mm × 6.00 mm
	HTQFP (48)	7.00 mm × 7.00 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

(2) The VQFN package is only available for preview.

2 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision A (July 2018) to Revision B	Page
• Added new applications	1
• Added updates to Description column in the Pin Functions table	5
• Added table note	19
• Changed the location of Backup Supply Power-Good section	28
• Added Programming section	48
Changes from Original (December 2017) to Revision A	Page
• Changed the maximum value for the input voltage for the LS3 parameter from 100 V to 10 V in the <i>Recommended Operating Conditions</i> table	8
• Added the <i>List of Recommended Capacitors</i> table in the <i>Output Capacitor Selection</i> section	96

3 Pin Configuration and Functions

Figure 3-1 shows the 48-pin RSL Plastic Quad Flatpack No-Lead. Figure 3-2 shows the 48-pin PHP PowerPAD™ Plastic Quad Flatpack.

3.1 Pin Functions

Pin Functions

PIN NO.	NAME	TYPE	DESCRIPTION
1	IN_DCDC1	P	Input supply pin for DCDC1.
2	SDA	I/O	Data line for the I ² C interface. Connect to pullup resistor.
3	SCL	I	Clock input for the I ² C interface. Connect to pullup resistor.
4	LDO1	O	Output voltage pin for LDO1. Connect to capacitor.
5	IN_LDO1	P	Input supply pin for LDO1.
6	IN_LS3	P	Input supply pin for load switch 3.
7	LS3	O	Output voltage pin for load switch 3. Connect to capacitor.
8	PGOOD	O	Power-good output (configured as open drain). Pulled low when either DCDC1-4 or LDO1 are out of regulation. Load switches and DCDC5-6 do not affect PGOOD pin.
9	AC_DET	I	AC monitor input and enable for DCDC1-4, LDO1 and load switches. See Section 5.4.1 for details. Tie pin to IN_BIAS if not used.
10	nPFO	O	Power-fail comparator output, deglitched (open drain). Pin is pulled low when PFI input is below power-fail threshold.
11	GPIO1	I/O	Pin configured as DDR reset-input (driving GPO2) or as general-purpose, open-drain output. See Section 5.3.1.14 for more information.
12	IN_DCDC4	P	Input supply pin for DCDC4.
13	L4A	P	Switch pin for DCDC4. Connect to inductor.
14	L4B	P	Switch pin for DCDC4. Connect to inductor.
15	DCDC4	P	Output voltage pin for DCDC4. Connect to capacitor.

Pin Functions (continued)

NO.	PIN NAME	TYPE	DESCRIPTION
16	PFI	I	Power-fail comparator input. Connect to resistor divider.
17	DC34_SEL	I	Power-up default selection pin for DCDC3 or DCDC4. Power-up default is programmed by a resistor connected to ground. See Section 5.3.1.13 for resistor options.
18	IN_nCC	O	Output pin indicates if DCDC5 and DCDC6 are powered from main supply (IN_BU) or coin-cell battery (CC). Pin is push-pull output. Pulled low when PMIC is powered from coin cell battery. Pulled high when PMIC is powered from main supply (IN_BU).
19	PGOOD_BU	O	Power-good, push-pull output for DCDC5 and DCDC6. Pulled low when either DCDC5 or DCDC6 is out of regulation. Pulled high (to DCDC6 output voltage) when both rails are in regulation.
20	L5	P	Switch pin for DCDC5. Connect to inductor.
21	FB5	I	Feedback voltage pin for DCDC5. Connect to output capacitor.
22	FB6	I	Feedback voltage pin for DCDC6. Connect to output capacitor.
23	L6	P	Switch pin for DCDC6. Connect to inductor.
24	SYS_BU	P	System voltage pin for battery-backup supply power path. Connect to 1-μF capacitor. Connecting any external load to this pin is not recommended.
25	CC	P	Coin cell battery input. Serves as the supply to DCDC5 and DCDC6 if no voltage is applied to IN_BU. Tie this pin to ground if it is not in use.
26	GPIO3	I/O	Pin can be configured as warm reset (negative edge) for DCDC1/2 or as a general-purpose, open-drain output. See Section 5.3.1.14 for more details.
27	IN_BU	P	Default input supply pin for battery backup supplies (DCDC5 and DCDC6).
28	N/C	—	No connect. Leave pin floating.
29	N/C		
30	LS1	O	Output voltage pin for load switch 1. Connect to capacitor.
31	IN_LS1	P	Input supply pin for load switch 1.
32	IN_LS2	P	Input supply pin for load switch 2.
33	LS2	O	Output voltage pin for load switch 2. Connect to capacitor.
34	GPO2	O	Pin configured as DDR reset signal (controlled by GPIO1) or as general-purpose output. Buffer can be configured as push-pull or open-drain.
35	INT_LDO	P	Internal bias voltage. Connect to a 1-μF capacitor. TI does not recommended connecting any external load to this pin.
36	IN_BIAS	P	Input supply pin for reference system.
37	IN_DCDC3	P	Input supply pin for DCDC3.
38	L3	P	Switch pin for DCDC3. Connect to inductor.
39	FB3	I	Feedback voltage pin for DCDC3. Connect to output capacitor.
40	nWAKEUP	O	Signal to SOC to indicate a power on event (active low, open-drain output).
41	FB2	I	Feedback voltage pin for DCDC2. Connect to output capacitor.
42	L2	P	Switch pin for DCDC2. Connect to inductor.
43	IN_DCDC2	P	Input supply pin for DCDC2.
44	PB	I	Push-button monitor input. Typically connected to a momentary switch to ground (active low). See Section 5.4.1 for details.
45	nINT	O	Interrupt output (active low, open drain). Pin is pulled low if an interrupt bit is set. The pin returns to Hi-Z state after the bit causing the interrupt has been read. Interrupts can be masked.
46	PWR_EN	I	Power enable input for DCDC1-4, LDO1 and load switches. See Section 5.4.1 for details.
47	FB1	I	Feedback voltage pin for DCDC1. Connect to output capacitor.
48	L1	P	Switch pin for DCDC1. Connect to inductor.
—	Thermal Pad	P	Power ground and thermal relief. Connect to ground plane.

4 Specifications

4.1 Absolute Maximum Ratings

Operating under free-air temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
Supply voltage	IN_BIAS, IN_LDO1, IN_LS2, IN_DCDC1, IN_DCDC2, IN_DCDC3, IN_DCDC4	–0.3	7	V
	IN_LS1, CC	–0.3	3.6	
	IN_LS3	–0.3	11.2	
	IN_BU	–0.3	5.8	
Input voltage	All pins unless specified separately	–0.3	7	V
Output voltage	All pins unless specified separately	–0.3	7	V
Source or sink current	GPO2		6	mA
	PGOOD_BU, IN_nCC		1	
Sink current	PGOOD, nWAKEUP, nINT, nPFO, SDA, GPIO1, GPIO3		6	mA
T _A	Operating ambient temperature	–40	105	°C
T _J	Junction temperature	–40	125	°C
T _{stg}	Storage temperature	–65	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

4.2 ESD Ratings

		VALUE	UNIT
V _(ESD)	Electrostatic discharge		V
	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±2000	
	Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±500	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

4.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

	MIN	NOM	MAX	UNIT
Supply voltage, IN_BIAS	2.7		5.5	V
Input voltage for DCDC1, DCDC2, DCDC3, DCDC4	2.7		5.5	V
Supply voltage, IN_BU	2.2		5.5	V
Supply voltage, CC	2.2		3.3	V
Input voltage for LDO1	1.8		5.5	V
Input voltage for LS1	1.2		3.6	V
Input voltage for LS2	3		5.5	V
Input voltage for LS3	1.8		10	V
Output voltage for DCDC1	0.85		1.675	V
Output voltage for DCDC2	0.85		1.675	V
Output voltage for DCDC3	0.9		3.4	V
Output voltage for DCDC4	1.175		3.4	V
Output voltage for DCDC5		1		V
Output voltage for DCDC6		1.8		V
Output voltage for LDO1	0.9		3.4	V
Output current for DCDC1, DCDC2, DCDC3	0		1.8	A
Output current for DCDC4	VIN_DCDC4 = 2.8 V		1	A
	VIN_DCDC4 = 3.6 V		1.3	
	VIN_DCDC4 = 5 V		1.6	
Output current for DCDC5, DCDC6	0		25	mA
Output current for LDO1	0		400	mA
Output current for LS1	0		300	mA
Output current for LS2	0		920	mA
Output current for LS3	VIN_LS3 > 2.3 V	0	900	mA
	VIN_LS3 ≤ 2.3 V	0	475	

4.4 Thermal Information

THERMAL METRIC ⁽¹⁾		TPS65218D0		UNIT
		RSL (VQFN)	PHP (HTQFP)	
		16 PINS	16 PINS	
R _{θJC(top)}	Junction-to-case (top)	17.2	13.3	°C/W
R _{θJB}	Junction-to-board	5.8	7.9	°C/W
R _{θJA}	Thermal resistance, junction to ambient. JEDEC 4-layer, high-K board.	30.6	26.7	°C/W
Ψ _{JT}	Junction-to-package top	0.2	0.3	°C/W
Ψ _{JB}	Junction-to-board	5.6	7.8	°C/W
R _{θJC(bot)}	Junction-to-case (bottom)	1.5	0.7	°C/W

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

4.5 Electrical Characteristics

over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
INPUT VOLTAGE AND CURRENTS						
V_{IN_BIAS}	Input supply voltage range	Normal operation	2.7		5.5	V
		EEPROM programming	4.5		5.5	
V_{UVLO}	Hysteresis	Supply rising	UVLOHYS = 0b		200	mV
			UVLOHYS = 1b		400	mV
	Deglitch time			5		ms
I_{OFF}	OFF state current, total current into IN_BIAS, IN_DCDCx, IN_LDO1, IN_LSx, IN_BU	$V_{IN} = 3.6$ V; All rails disabled. $T_J = 0^{\circ}\text{C}$ to 85°C		5		μA
$I_{SUSPEND}$	SUSPEND current, total current into IN_BIAS, IN_DCDCx, IN_LDO1, IN_LSx, IN_BU	$V_{IN} = 3.6$ V; DCDC3 enabled, low-power mode, no load. All other rails disabled. $T_J = 0^{\circ}\text{C}$ to 105°C		220		μA
SYS_BU						
V_{SYS_BU}	SYS_BU voltage range	Powered from V_{IN_BU} or V_{CC}	2.2		5.5	V
C_{SYS_BU}	Recommended SYS_BU capacitor	Ceramic, X5R or X7R, see Table 6-3		1		μF
	Tolerance	Ceramic, X5R or X7R, rated voltage ≥ 6.3 V	-20%		20%	
INT_LDO						
V_{INT_LDO}	Output voltage			2.5		V
	DC accuracy	$I_{OUT} < 10$ mA	-2%		2%	
I_{OUT}	Output current range	Maximum allowable external load	0		10	mA
I_{LIMIT}	Short circuit current limit	Output shorted to GND		23		mA
t_{HOLD}	Hold-up time	Measured from $V_{INT_LDO} = 2.3$ V to $V_{INT_LDO} = 1.8$ V All rails enabled before power off, IN_BIAS tied to IN_DCDC1-4, IN_LDO1 $V_{IN_BIAS} = 2.8$ V to 0 V in < 5 μs No external load on INT_LDO $C_{INT_LDO} = 1$ μF , see Table 6-3		150		ms
C_{OUT}	Nominal output capacitor value	Ceramic, X5R or X7R, see Table 6-3	0.1	1	22	μF
	Tolerance	Ceramic, X5R or X7R, rated voltage ≥ 6.3 V	-20%		20%	
DCDC1 (1.1-V BUCK)						
V_{IN_DCDC1}	Input voltage range	$V_{IN_BIAS} > V_{UVLO}$	2.7		5.5	V
V_{DCDC1}	Output voltage range	Adjustable through I ² C	0.85		1.675	V
	DC accuracy	$2.7\text{ V} \leq V_{IN} \leq 5.5\text{ V}$; $0\text{ A} \leq I_{OUT} \leq 1.8\text{ A}$	-2%		2%	
	Dynamic accuracy	In respect to nominal output voltage $I_{OUT} = 50$ mA to 450 mA in < 1 μs $C_{OUT} \geq 10$ μF , over full input voltage range	-2.5%		2.5%	
I_{OUT}	Continuous output current	$V_{IN_DCDC1} > 2.7$ V			1.8	A
I_Q	Quiescent current	Total current from IN_DCDC1 pin; Device not switching, no load		25	50	μA
$R_{DS(ON)}$	High-side FET on resistance	$V_{IN_DCDC1} = 3.6$ V		230	355	$\text{m}\Omega$
	Low-side FET on resistance	$V_{IN_DCDC1} = 3.6$ V		90	145	
I_{LIMIT}	High-side current limit	$V_{IN_DCDC1} = 3.6$ V		2.8		A
	Low-side current limit	$V_{IN_DCDC1} = 3.6$ V		3.1		

Electrical Characteristics (continued)

5 Detailed Description

5.1 Overview

The TPS65218D0 provides three step-down converters, three load switches, three general-purpose I/Os, two battery backup supplies, one buck-boost converter and one LDO. The system can be supplied by a single cell Li-Ion battery or regulated 5-V supply. A coin-cell battery can be added to supply the two always-on backup supplies. The device is characterized across a -40°C to $+105^{\circ}\text{C}$ temperature range, which makes it suitable for various industrial applications.

The I²C interface provides comprehensive features for using TPS65218D0. All rails, load switches, and GPIOs can be enabled / disabled. Voltage thresholds for the UVLO and supervisor can be customized. Power-up and power-down sequences can also be programmed through I²C. Interrupts for overtemperature, overcurrent, and undervoltage can be monitored for the load-switches (LSx).

The integrated voltage supervisor monitors DCDC 1-4 and LDO1. It has two settings; the standard settings only monitor for undervoltage, while the strict settings implement tight tolerances on both undervoltage and overvoltage. A power good signal is provided to report the regulation state of the five rails.

The three hysteretic step-down converters can each supply up to 1.8 A of current. The default output voltages for each converter can be adjusted through the I²C interface. DCDC 1 and 2 feature dynamic voltage scaling with adjustable slew rate. The step-down converters operate in a low power mode at light load, and can be forced into PWM operation for noise sensitive applications.

The battery backup supplies consist of two low power step-down converters optimized for very light loads and are monitored with a separate power good signal (PGOOD_BU). The converters can be configured to operate as always-on supplies with the addition of a coin cell battery. The state of the battery can be monitored over I²C.

5.3 Feature Description

5.3.1 Wake-Up and Power-Up and Power-Down Sequencing

The TPS65218D0 has a predefined power-up and power-down sequence, which in a typical application does not need to be changed. The user can define custom sequences with I²C. The power-up sequence is defined by a series of ten strobes and nine delay times. Each output rail is assigned to a strobe to determine the order of enabling rails. A single rail is assigned to only one strobe, but multiple rails can be assigned to the same strobe. The delay times between strobes are between 2 ms and 5 ms.

5.3.1.1 Power-Up Sequencing

When the power-up sequence initiates, STROBE1 occurs, and any rail assigned to this strobe is enabled. After a delay time of DLY1, STROBE2 occurs and the rail assigned to this strobe is powered up. The sequence continues until all strobes occur and all DLYx times execute. Strobe assignments and delay times are defined in the SEQx registers, and are changed under I²C control. The power-up sequence executes if one of the following events occurs:

- From the OFF state:
 - The push-button (PB) is pressed (falling edge on PB) **OR**
 - The AC_DET pin is pulled low (falling edge) **OR**
 - The PWR_EN is asserted (driven to high-level) **OR**
 - The main power is connected (IN_BIAS) and AC_DET is grounded **AND**
 - The device is not in undervoltage lockout (UVLO) or overtemperature shutdown (OTS).
- From the PRE_OFF state:
 - The PB is pressed (falling edge on PB) **OR**
 - The AC_DET pin is pulled low (falling edge) **OR**
 - PWR_EN is asserted (driven to high-level) **AND**
 - The device is not in UVLO or OTS.
- From the SUSPEND state:
 - The PB is pressed (falling edge on PB) **OR**
 - The AC_DET pin is pulled low (falling edge) **OR**
 - The PWR_EN pin is pulled high (level sensitive) **AND**
 - The device is not in UVLO or OTS.

When a power-up event is detected, the device enters a WAIT_PWR_EN state and triggers the power-up sequence. The device remains in WAIT_PWR_EN as long as the PWR_EN and either the PB or AC_DET pin are held low. If both, the PB and AC_DET return to logic-high state and the PWR_EN pin has not been asserted within 20 s of entering WAIT_PWR_EN state, the power-down sequence is triggered and the device returns to OFF state. Once PWR_EN is asserted, the device advances to ACTIVE state, which is functionally equivalent to WAIT_PWR_EN. However, the AC_DET pin is ignored and power-down is controlled by the PWR_EN pin only.

Rails not assigned to a strobe (SEQ = 0000b) are not affected by power-up and power-down sequencing and remain in their current ON/OFF state regardless of the sequencer. A rail can be enabled/disabled at any time by setting the corresponding enable bit in the ENABLEx register, with the exception that the ENABLEx register cannot be accessed while the sequencer is active. Enable bits always reflect the current enable state of the rail, for example the sequencer sets and resets the enable bits for the rails under its control.

NOTE

The power-up sequence is defined by strobes and delay times, and can be triggered by the PB, AC_DET (not shown, same as PB), or PWR_EN pin.

**Figure 5-1. Power-Up Sequences from OFF or SUSPEND State;
PB is Power-Up Event**

**Figure 5-2. Power-Up Sequences from SUSPEND State;
PWR_EN is Power-Up Event**

Figure 5-3. Power-Up Sequences from RECOVERY State

5.3.1.2 Power-Down Sequencing

By default, the power-down sequence follows the reverse of the power-up sequence. When the power-down sequence is triggered, STROBE10 occurs and any rail assigned to STROBE10 is shut down and its discharge circuit is enabled. After a delay time of DLY9, STROBE9 occurs and any rail assigned to it is shut down and its discharge circuit is enabled. The sequence continues until all strobes occur and all DLYx times execute. The DLYx times are extended by a factor of 10x to provide ample time for discharge, and preventing output voltages from crossing during shut-down. The DLYFCTR bit is applied globally to all power-down delay times. Regardless of the DLYx and DLYFCTR settings, the PMIC enters OFF, SUSPEND, or RECOVERY state 500 ms after the power-down sequence initiates, to ensure that the discharge circuits remain enabled for a minimum of 150 ms before the next power-up sequence starts.

A power-down sequence executes if one of the following events occurs:

- The device is in the WAIT_PWR_EN state, the PB and AC_DET pins are high, PWR_EN is low, and the 20-s timer has expired.
- The device is in the ACTIVE state and the PWR_EN pin is pulled low.
- The device is in the WAIT_PWR_EN, ACTIVE, or SUSPEND state and the push-button is held low for > 8 s (15 s if TRST = 1b)
- A fault occurs in the IC (OTS, UVLO, PGOOD failure).

When transitioning from ACTIVE to SUSPEND state, rails not controlled by the power-down sequencer maintains the same ON/OFF state in SUSPEND state that it had in ACTIVE state. This allows for the selected power rails to remain powered up when in the SUSPEND state.

When transitioning to the OFF or RECOVERY state, rails not under sequencer control are shut-down as follows:

- DCDC1, 2, 3, 4, LDO1, and LS1 shut down at the beginning of the power-down sequence, if not under sequencer control (SEQ = 0b).
- LS2 and LS3 shut down as the state machine enters an OFF or RECOVERY state; 500 ms after the power-down sequence is triggered.

If the supply voltage on IN_BIAS drops below 2.5 V, the digital core is reset and all power rails are shut down instantaneously and are pulled low to ground by their internal discharge circuitry (DCDC1-4, and LDO1). The amount of time the discharge circuitry remains active is a function of the INT_LDO hold up time (see [Section 5.3.1.6](#) for more details).

5.3.1.3 Strokes 1 and 2

STROBE1 and STROBE2 are dedicated to DCDC5 and DCDC6 which are *always-on*; powered up as soon as the device exits the OFF state, and ON in any other state. STROBE 1 and 2 options are available only for DCDC5 and DCDC6, not for any other rails.

STROBE 1 and STROBE 2 occur in every power-up sequence, regardless if the rail is already powered up. If the rail is not to be powered up, its respective strobe setting must be set to 0x00.

When a power-down sequence initiates, STROBE1 and STROBE2 occur only if the FSEAL bit is 0b. Otherwise, both strobes are omitted and DCDC5 and DCDC6 maintain state.

NOTE

The power-down sequence follows the reverse of the power-up sequence. STROBE2 and STROBE1 are executed only if FSEAL bit is 0b.

**Figure 5-4. Power-Down Sequences to OFF State;
PWR_EN is Power-Down Event; FSEAL = 0b**

**Figure 5-5. Power-Down Sequences to SUSPEND State;
PWR_EN is Power-Down Event; FSEAL = 1b**

**Figure 5-6. Power-Down Sequences to RECOVERY State;
TSD or UV is Power-Down Event; FSEAL = 1b**

5.3.1.4 Supply Voltage Supervisor and Power Good (PGOOD)

Power-good (PGOOD) is an open-drain output of the built-in voltage supervisor that monitors DCDC1, DCDC2, DCDC3, DCDC4, and LDO1. The output is Hi-Z when all enabled rails are in regulation and driven low when one or more rails encounter a fault which brings the output voltage outside the specified tolerance range. In a typical application PGOOD drives the reset signal of the SOC.

The supervisor has two modes of operation, controlled by the STRICT bit. With the STRICT bit set to 0, all enabled rails of the five regulators are monitored for undervoltage only with relaxed thresholds and deglitch times. With the STRICT bit set to 1, all enabled rails of the five regulators are monitored for undervoltage and overvoltage with tight limits and short deglitch times. [Table 5-1](#) summarizes these details.

Table 5-1. Supervisor Characteristics Controlled by the STRICT Bit

PARAMETER		STRICT = 0b (TYP)	STRICT = 1b (TYP)
Undervoltage monitoring	Threshold (output falling)	90%	96.5% (DCDC1, DCDC2) 95.5% (DCDC3, DCDC4, LDO1)
	Deglitch (output falling)	1 ms	50 μ s
	Deglitch (output rising)	10 μ s	10 μ s
Overvoltage monitoring	Threshold (output falling)	N/A	103.5% (DCDC1, DCDC2) 104.5% (DCDC3, DCDC4, LDO1)
	Deglitch (output falling)	N/A	1 ms
	Deglitch (output rising)	N/A	50 μ s

Figure 5-7. Definition of Undervoltage, Overvoltage Thresholds, Hysteresis, and Deglitch Times

The following rules apply to the PGOOD output:

- The power-up default state for PGOOD is low. When all rails are disabled, PGOOD output is driven low.
- Only enabled rails are monitored. Disabled rails are ignored.
- Power-good monitoring of a particular rail starts 5 ms after the rail is enabled and is continuously monitored thereafter. This allows the rail to power-up.
- PGOOD is delayed by PGDLY time after the sequencer is finished and the last rail is enabled.
- If an enabled rail is continuously outside the monitoring threshold for longer than the deglitch time, PGOOD is pulled low, and all rails are shut-down following the power-down sequence. PGDLY does not apply.

- Disabling a rail manually by resetting the DCx_EN or LDO1_EN bit has no effect on the PGOOD pin. If all rails are disabled, PGOOD is driven low as the last rail is disabled.
- If the power-down sequencer is triggered, PGOOD is driven low.
- PGOOD is driven low in SUSPEND state, regardless of the number of rails that are enabled.

Figure 5-8 shows a typical power-up sequence and PGOOD timing.

Figure 5-8. Typical Power-Up Sequence of the Main Output Rails

5.3.1.5 Backup Supply Power-Good (PGOOD_BU)

PGOOD_BU is a push-pull output indicating if DCDC5 and DCDC6 are in regulation. The output is driven to high when both rails are in regulation, and driven low if at least one of the rails is below the power-good threshold. The output-high level is equal to the output voltage of DCDC6.

PGOOD_BU is the logical AND between PGOOD(DCDC5) and PGOOD(DCDC6), and has no delay time built-in. Unlike main power-good, a fault on DCDC5 or DCDC6 does not trigger the power-down sequencer, does not disable any of the rails in the system, and has no effect on the PGOOD pin. DCDC5 and DCDC6 recover automatically once the fault is removed.

NOTE

In this example, the power-down is triggered by a fault on DCDC3.

This timing diagram assumes each rail powers up within the strobe delay time. If a rail takes longer than the strobe delay time to power up, the next rail will wait for the previous rail to reach its PGOOD voltage, and then may wait an additional 1ms until it is enabled.

Figure 5-9. Typical Power-Up Sequence of DCDC5 and DCDC6

5.3.1.6 Internal LDO (INT_LDO)

The internal LDO (INT_LDO) provides a regulated voltage to the internal digital core and analog circuitry. The internal LDO has a nominal output voltage of 2.5 V and can support up to 10 mA of external load. During EEPROM programming, the output voltage is elevated to 3.6 V as described in [Section 5.5.1](#). Therefore, any external circuitry connected to INT_LDO must be capable of supporting that voltage.

When system power fails, the UVLO comparator triggers the power-down sequence. If system power drops below 2.3 V, the digital core is reset and all remaining power rails are shut down instantaneously and are pulled low to ground by their internal discharge circuitry (DCDC1-4, and LDO1).

The internal LDO reverse blocks to prevent the discharging of the output capacitor (C_{INT_LDO}) on the INT_LDO pin. The remaining charge on the INT_LDO output capacitor provides a supply for the power rail discharge circuitry to ensure the outputs are discharged to ground even if the system supply has failed. The amount of hold-up time specified in [Section 4.5](#) is a function of the output capacitor value (C_{INT_LDO}) and the amount of external load on the INT_LDO pin, if any. The design allows for enough hold-up time to sufficiently discharge DCDC1-4, and LDO1 to ensure proper processor power-down sequencing.

Figure 5-10. Internal LDO and UVLO Sensing

5.3.1.7 Current Limited Load Switches

The TPS65218D0 provides three current limited load switches with individual inputs, outputs, and enable control. Each switch provides the following control and diagnostic features:

- The ON/OFF state of the switch is controlled by the corresponding LSx_EN bit in the ENABLE register.
- LS1 can be controlled by the sequencer or through I²C communication.
- LS2 and LS3 can ONLY be controlled through I²C communication. The sequencer has no control over LS2 and LS3.
- Each switch has an active discharge function, disabled by default, and enabled through the LSxDCHRG bit. When enabled, the switch output is discharged to ground whenever the switch is disabled.
- When the PFI input drops below the power-fail threshold (the power-fail comparator trips), the load switches are automatically disabled to shed system load. This function must be individually enabled for each switch through the corresponding LSxnPFO bit. The switches do not turn back on automatically as the system voltage recovers, and must be manually re-enabled.
- An interrupt (LSx_I) issues whenever a load switch actively limits the output current, such as when the output load exceeds the current limit value. The switch remains ON and provides current to the load according to the current-limit setting.
- All three load switches have local overtemperature sensors which disable the corresponding switch if the power dissipation and junction temperature exceeds safe operating value. The switch automatically recovers once the temperature drops below the OTS threshold value minus hysteresis. The LSx_F (fault) interrupt bit is set while the switch is held OFF by the OTS function.

5.3.1.7.1 Load Switch 1 (LS1)

LS1 is a non-reverse blocking, low-voltage (< 3.6 V), low-impedance switch intended to support DDRx self-refresh mode by cutting off the DDRx supply to the SOC DDRx interface during SUSPEND mode. In a typical application, the input of LS1 is tied to the output of DCDC3 while the output of LS1 is connected to the memory-interface supply pin of the SOC. LS1 can be controlled by the internal sequencer, just as any power rail.

Figure 5-11. Typical Application of Load Switch 1

5.3.1.7.2 Load Switch 2 (LS2)

LS2 is a reverse-blocking, 5 V, low-impedance switch. Load switch 2 provides four different current limit values (100/200/500/1000 mA) that are selectable through LS2ILIM[1:0] bits. Overcurrent is reported through the LS2_I interrupt.

LS2 has its own input-undervoltage protection which forces the switch OFF if the switch input voltage (V_{IN_LS2}) is <2.7 V. Similar to OTS, the LS2_F interrupt is set when the switch is held OFF by the local UVLO function, and the switch recovers automatically when the input voltage rises above the UVLO threshold.

Figure 5-12. Typical Application of Load Switch 2

5.3.1.7.3 Load Switch 3 (LS3)

LS3 is a non-reverse blocking, medium-voltage (< 10 V), low-impedance switch that can be used to provide 1.8-V to 10-V power to an auxiliary port. LS3 has four selectable current limit values that are selectable through LS3ILIM[1:0].

Figure 5-13. Typical Application of Load Switch 3

5.3.1.8 LDO1

LDO1 is a general-purpose LDO intended to provide power to analog circuitry on the SOC. LDO1 has an input voltage range from 1.8 V to 5.5 V, and can be connected either directly to the system power or the output of a DCDC converter. The output voltage is programmable in the range of 0.9 V to 3.4 V with a default of 1.8 V. LDO1 supports up to 200 mA at the minimum specified headroom voltage, and up to 400 mA at the typical operating condition of $V_{OUT} = 1.8$ V, $V_{IN_LDO1} > 2.7$ V.

5.3.1.9 Coin Cell Battery Voltage Acquisition

Figure 5-14. Left: Flow Chart for Acquiring Coin Cell Battery Voltage
Right: Comparator Circuit

5.3.1.10 UVLO

Depending on the slew rate of the input voltage into the IN_BIAS pin, the power rails of TPS65218D0 will be enabled at either V_{ULVO} or $V_{ULVO} + V_{HYS}$.

If the slew rate of the IN_BIAS voltage is greater than 30 V/s, then TPS65218D0 will power up at V_{ULVO} . Once the input voltage rises above this level, the input voltage may drop to the V_{ULVO} level before the PMIC shuts down. In this scenario, if the input voltage were to fall below V_{ULVO} but above 2.55 V, the input voltage would have to recover above V_{ULVO} in less than 5 ms for the device to remain active.

If the slew rate of the IN_BIAS voltage is less than 30 V/s, then TPS65218D0 will power up at $V_{UVLO} + V_{HYS}$. Once the input voltage rises above this level, the input voltage may drop to the V_{UVLO} level before the PMIC shuts down. In this scenario, if the input voltage were to fall below V_{UVLO} but above 2.5 V, the input voltage would have to recover above $V_{UVLO} + V_{HYS}$ in less than 5 ms for the device to remain active.

In either slew rate scenario, if the input voltage were to fall below 2.5 V, the digital core is reset and all remaining power rails are shut down instantaneously and are pulled low to ground by their internal discharge circuitry (DCDC1-4, and LDO1).

Figure 5-15. Definition of UVLO and Hysteresis

After the UVLO triggers, the internal LDO blocks current flow from its output capacitor back to the IN_BIAS pin, allowing the digital core and the discharge circuits to remain powered for a limited amount of time to properly shut-down and discharge the output rails. The hold-up time is determined by the value of the capacitor connected to INT_LDO. See [Section 5.3.1.6](#) for more details.

5.3.1.11 Power-Fail Comparator

The power-fail comparator notifies the system host if the system supply voltage drops and the system is at risk of shutting down. The comparator has an internal 800-mV threshold and the trip-point is adjusted by an external resistor divider.

By default, the power-fail comparator has no impact on any of the power rails or load switches. Load switches are configured individually, to be disabled when the PFI comparator trips to shed system load and extend hold-up time as described in [Section 5.3.1.7](#). The power-fail comparator also triggers the power-down sequencer, such that all or selective rails power down when the system voltage fails. To tie the power-fail comparator into the power-down sequence, the OFFnPFO bit in the CONTROL register must be set to 1.

The power-fail comparator cannot be monitored by software, such that no interrupt or status bit is associated to this function.

Figure 5-16. Power-Fail Comparator Simplified Circuit and Timing Diagram

5.3.1.12 Battery-Backup Supply Power-Path

DCDC5 and DCDC6 are supplied from either the CC (coin-cell battery) input or IN_BU (main system supply). The power-path is designed to prioritize IN_BU to maximize coin-cell battery life. Whenever the PMIC is powered-up (WAIT_PWR_EN, ACTIVE, SUSPEND, RECOVERY state), the power-path is forced to select the IN_BU input. In OFF mode the power-path selects the higher of the two inputs with a built-in hysteresis of 150 mV as shown in Figure 5-17.

Figure 5-17. Switching Behavior of the Battery-Backup-Supply Power-Path; Power-Path Hysteresis

Figure 5-18. Switching Behavior of the Battery-Backup-Supply Power-Path; Main Power Supply Removal

Figure 5-19. Switching Behavior of the Battery-Backup-Supply Power-Path; Weakening Main Battery, Strong Coin-Cell

Figure 5-20. Switching Behavior of the Battery-Backup-Supply Power-Path; Weakening Main Battery, Weak Coin-Cell

When V_{IN_BIAS} drops below the UVLO threshold, the PMIC shuts down all rails and enters OFF mode. At this point the power-path selects the higher of the two input supplies. If the coin-cell battery is less than 150 mV above the UVLO threshold, SYS_BU remains connected to IN_BU (see Figure 5-19). If the coin-cell is >150 mV above the UVLO threshold, the power-path switches to the CC input as shown in Figure 5-20. With no load on the main supply, the input voltage may recover over time to a value greater than the coin-cell voltage and the power-path switches back to IN_BU. This is a typical behavior in a Li-Ion battery powered system.

Depending on the system load, V_{IN_BIAS} may drop below V_{INT_LDO} before the power-down sequence is completed. In that case, INT_LDO is turned OFF and the digital core is reset forcing the unit into OFF mode and the power-path switches to IN_BU as shown in Figure 5-18.

5.3.1.13 DCDC3 / DCDC4 Power-Up Default Selection

**Figure 5-21. Left: Flow Chart for Selecting DCDC Power-Up Default Voltage
Right: Comparator Circuit**

Table 5-2. Power-Up Default Values of DCDC3 and DCDC4

RSEL [KΩ]			POWER-UP DEFAULT	
MIN	TYP	MAX	DCDC3[5:0]	DCDC4[5:0]
0	0	7.7	Programmed default (1.2 V)	Programmed default (3.3 V)
11.8	12.1	12.4	0x12 (1.35 V)	Programmed default (3.3 V)
19.5	20	20.5	0x18 (1.5 V)	Programmed default (3.3 V)
30.9	31.6	32.3	0x1F (1.8 V)	Programmed default (3.3 V)
44.4	45.3	46.3	0x3D (3.3 V)	0x01 (1.2 V)
64.8	66.1	67.3	Programmed default (1.2 V)	0x07 (1.35 V)
93.6	95.3	97.2	Programmed default (1.2 V)	0x0D (1.5 V)
146	150	Tied to INT_LDO	Programmed default (1.2 V)	0x14 (1.8 V)

5.3.1.14 I/O Configuration

The device has two GPIOs and one GPO pin which are configured as follows:

- GPIO1:
 - General-purpose, open-drain output controlled by GPO1 user bit or sequencer
 - DDR3 reset input signal from SOC. Signal is either latched or pass-through to GPO2 pin. See [Table 5-3](#) for details.
- GPO2:
 - General-purpose output controlled by GPO2 user bit
 - DDR3 reset output signal. Signal is controlled by GPIO1 and PGOOD. See [Table 5-4](#) for details.
 - Output buffer is configured as open-drain or push-pull.
- GPIO3:
 - General-purpose, open-drain output controlled by GPO3 user bit or sequencer
 - Reset input-signal for DCDC1 and DCDC2

Table 5-3. GPIO1 Configuration

IO1_SEL (EEPROM)	GPO1 (USER BIT)	PGOOD (PMIC SIGNAL)	GPIO1 (I/O PIN)	COMMENTS
0	0	X	0	Open-drain output, driving low
0	1	X	HiZ	Open-drain output, HiZ
1	X	0	X	Pin is configured as input and intended as DDR RESET signal. Coming out of POR, GPO2 is driven low. Otherwise, GPO2 status is latched at falling edge of PGOOD. See Figure 5-24 .
1	X	1	0	Pin is configured as input and intended as DDR RESET signal. GPO2 is driven low.
1	X	1	1	Pin is configured as input and intended as DDR RESET signal. GPO2 is driven high.

Table 5-4. GPO2 Configuration

IO1_SEL (EEPROM)	GPO2_BUF (EEPROM)	GPO2 (USER BIT)	COMMENTS
0	0	0	GPO2 is open drain output controlled by GPO2 user bit (driving low).
0	0	1	GPO2 is open drain output controlled by GPO2 user bit (HiZ).
0	1	0	GPO2 is push-pull output controlled by GPO2 user bit (driving low).
0	1	1	GPO2 is push-pull output controlled by GPO2 user bit (driving high).
1	0	X	GPO2 is open drain output controlled by GPIO1/PGOOD.
1	1	X	GPO2 is push-pull output controlled by GPIO1/PGOOD.

Table 5-5. GPIO3 Configuration

DC12_RST (EEPROM)	GPO3 (USER BIT)	GPIO3 (I/O PIN)	COMMENTS
0	0	0	Open-drain output, driving low
0	1	HiZ	Open-drain output, HiZ
1	X	Active low	GPIO3 is DCDC1 and DCDC2 reset input signal to PMIC (active low). See Section 5.3.1.14.2 for details.

5.3.1.14.1 Configuring GPO2 as Open-Drain Output

GPO2 may be configured as open-drain or push-pull output. The supply for the push-pull driver is internally connected to the IN_LS1 input pin, whereas an external pullup resistor and supply are required in the open-drain configuration. Because of the internal connection to IN_LS1, the external pullup supply must not exceed the voltage on the IN_LS1 pin, otherwise leakage current may be observed from GPO2 to IN_LS1 as shown in Figure 5-22.

Figure 5-22. GPO2 as Open-Drain Output

NOTE

When configured as open-drain output, the external pullup supply must not exceed the voltage level on IN_LS1 pin.

5.3.1.14.2 Using GPIO3 as Reset Signal to DCDC1 and DCDC2

With the DC12_RST bit set to 1, GPIO3 is an edge-sensitive reset input to the PMIC. The reset signal affects DCDC1 and DCDC2 only, so that only those two registers are reset to the power-up default whenever GPIO3 input transitions from high to low, while all other registers maintain their current values. DCDC1 and DCDC2 transition back to the default value following the SLEW settings, and are not power cycled. This function recovers the processor from reset events while in low-power mode.

Figure 5-23. I/O Pin Logic

Figure 5-24. DDR3 Reset Timing Diagram

NOTE

GPIO must be configured as input (IO1_SEL = 1b). GPO2 is automatically configured as output.

5.3.1.15 Push Button Input (PB)

The PB pin is a CMOS-type input used to power-up the PMIC. Typically, the PB pin is connected to a momentary switch to ground and an external pullup resistor. The power-up sequence is triggered if the PB input is held low for 600 ms.

**Figure 5-25. Left: Typical PB Input Circuit
Right: Push-Button Input (PB) Deglitch and Power-Up Timing**

In ACTIVE mode, the TPS65218D0 monitors the PB input and issues an interrupt when the pin status changes, such as when it drops below or rises above the PB input-low or input-high thresholds. The interrupt is masked by the PBM bit in the INT_MASK1 register.

**Figure 5-26. PB Input-Low or Input-High Thresholds****NOTE**

Interrupts are issued whenever the PB pin status changes. The PB_STATE bit reflects the current status of the PB input. nWAKEUP is pulled low for 150 μs on every falling edge of PB.

5.3.1.15.1 Signaling PB-Low Event on the nWAKEUP Pin

In ACTIVE state, the nWAKEUP pin is pulled low for five 32-kHz clock cycles (approximately 150 μ s) whenever a falling edge on the PB input is detected. This allows the host processor to wakeup from DEEP SLEEP mode of operation. It is recommended to pull-up the nWAKEUP pin to DCDC6 output through a 1-M Ω resistor.

5.3.1.15.2 Push Button Reset

If the PB input is pulled low for 8 s (15 s if TRST = 1b) or longer, all rails except for DCDC5 and DCDC6 are disabled, and the device enters the RECOVERY state. The device powers up automatically after the 500 ms power-down sequence is complete, regardless of the state of the PB input. Holding the PB pin low for 8 s (15 s if TRST = 1b), only turns off the device temporarily and forces a system restart, and is not a power-down function. If the PB is held low continuously, the device power-cycles in 8-s and 15-s intervals.

5.3.1.16 AC_DET Input (AC_DET)

The AC_DET pin is a CMOS-type input used in three different ways to control the power-up of the PMIC:

- In a battery operated system, AC_DET is typically connected to an external battery charger with an open-drain power-good output pulled low when a valid charger supply is connected to the system. A falling edge on the AC_DET pin causes the PMIC to power up.
- In a non-portable system, the AC_DET pin may be shorted to ground and the IC powers up whenever system power is applied to the chip.
- If none of the above behaviors are desired, AC_DET may be tied to system power (IN_BIAS). Power-up is then controlled through the push-button input or PWR_EN input.

Figure 5-27. AC_DET Pin Configurations

Figure 5-28. AC_DET Input Deglitch and Power-Up Timing (Portable Systems)

In ACTIVE state, the TPS65218D0 monitors the AC_DET input and issues an interrupt when the pin status changes, such as when it drops below or rises above the AC_DET input-low or input-high thresholds. The interrupt is masked by the ACM bit in the INT_MASK1 register.

Figure 5-29. AC_STATE Pin

NOTE

Interrupts are issued whenever the AC_DET pin status changes. The AC_STATE bit reflects the current status of the AC_DET input.

5.3.1.17 Interrupt Pin (INT)

The interrupt pin signals any event or fault condition to the host processor. Whenever a fault or event occurs in the IC, the corresponding interrupt bit is set in the INT register, and the open-drain output is pulled low. The INT pin is released (returns to Hi-Z state) and fault bits are cleared when the host reads the INT register. If a failure persists, the corresponding INT bit remains set and the INT pin is pulled low again after a maximum of 32 μ s.

The MASK register masks events from generating interrupts. The MASK settings affect the INT pin only, and have no impact on the protection and monitor circuits.

5.3.1.18 I²C Bus Operation

The TPS65218D0 hosts a slave I²C interface (address 0x24) that supports data rates up to 400kbps, auto-increment addressing. ⁽¹⁾

Figure 5-30. Subaddress in I²C Transmission

The I²C bus is a communications link between a controller and a series of slave terminals. The link is established using a two-wired bus consisting of a serial clock signal (SCL) and a serial data signal (SDA). The serial clock is sourced from the controller in all cases where the serial data line is bi-directional for data communication between the controller and the slave terminals. Each device has an open drain output to transmit data on the serial data line. An external pullup resistor must be placed on the serial data line to pull the drain output high during data transmission.

Data transmission initiates with a start bit from the controller as shown in Figure 5-32. The start condition is recognized when the SDA line transitions from high to low during the high portion of the SCL signal. Upon reception of a start bit, the device receives serial data on the SDA input and checks for valid address and control information. If the appropriate slave address is set for the device, the device issues an acknowledge pulse and prepares to receive register address and data. Data transmission is completed by either the reception of a stop condition or the reception of the data word sent to the device. A stop condition is recognized as a low to high transition of the SDA input during the high portion of the SCL signal. All other transitions of the SDA line must occur during the low portion of the SCL signal. An acknowledge issues after the reception of valid slave address, register-address, and data words. The I²C interfaces auto-sequence through register addresses, so that multiple data words can be sent for a given I²C transmission. Reference Figure 5-31 and Figure 5-32 for details.

Figure 5-31. I²C Data Protocol

(1) Note: The SCL duty cycle at 400 kHz must be >40%.

I²C Data Transmission Timing**

5.4 Device Functional Modes

5.4.1 Modes of Operation

Figure 5-34. Modes of Operation Diagram

5.4.2 OFF

In OFF mode, the PMIC is completely shut down with the exception of a few circuits to monitor the AC_DET, PWR_EN and PB input. All power rails are turned off and the registers are reset to their default values. The I²C communication interface is turned off. This is the lowest-power mode of operation. To exit OFF mode V_{IN_BIAS} must exceed the UVLO threshold and one of the following wake-up events must occur:

- The PB input is pulled low.
- THE AC_DET input is pulled low.
- The PWR_EN input is pulled high.

To enter OFF state, ensure all power rails are assigned to the sequencer, then pull the PWR_EN pin low. Additionally, if the OFFnPF0 bit is set to 1b and the PFI input falls below the power fail threshold the device transitions to the OFF state. If the freshness seal is broken, DCDC5 and DCDC6 remains on in the OFF state.

If a PGOOD or OTS fault occurs while in the ACTIVE state, TPS65218D0 will transition to the RESET state.

5.4.3 ACTIVE

This is the typical mode of operation when the system is up and running. All DCDC converters, LDOs, and load switches are operational and can be controlled through the I²C interface. After a wake-up event, the PMIC enables all rails controlled by the sequencer and pulls the nWAKEUP pin low to signal the event to the host processor. The device only enters ACTIVE state if the host asserts the PWR_EN pin within 20 s after the wake-up event. Otherwise it will enter OFF state. The nWAKEUP pin returns to HiZ mode after the PWR_EN pin is asserted. ACTIVE state can also be directly entered from SUSPEND state by pulling the PWR_EN pin high. See SUSPEND state description for details. To exit ACTIVE mode, the PWR_EN pin must be pulled low.

5.4.4 SUSPEND

SUSPEND state is a low-power mode of operation intended to support system standby. Typically all power rails are turned off with the exception of any rail with an SEQ register set to 0h. DCDC5 and DCDC6 also remain enabled if the freshness seal is broken. To enter SUSPEND state, pull the PWR_EN pin low. All power rails controlled by the power-down sequencer are shut down, and after 500 ms the device enters SUSPEND state. All rails not controlled by the power-down sequencer will maintain state. Note that all register values are reset as the device enters the SUSPEND state. The device enters ACTIVE state after it detects a wake-up event as described in the previous sections.

5.4.5 RESET

The TPS65218D0 can be reset by holding the PB pin low for more than 8 or 15 s, depending on the value of the TRST bit. All rails are shut down by the sequencer and all register values reset to their default values. Rails not controlled by the sequencer are shut down additionally. Note that the RESET function power-cycles the device and only temporarily shuts down the output rails. Resetting the device does not lead to OFF state. If the PB_IN pin is kept low for an extended amount of time, the device continues to cycle between ACTIVE and RESET state, entering RESET every 8 or 15 s.

The device is also reset if a PGOOD or OTS fault occurs. The TPS65218D0 remains in the recovery state until the fault is removed, at which time it transitions back to the ACTIVE state.

5.5 Programming

5.5.1 Programming Power-Up Default Values

A consecutive write of 0x50, 0x1A, or 0xCE to the password register commits the current register settings to EEPROM memory so they become the new power-up default values.

NOTE

Only bits marked with (E2) in the register map have EEPROM programmable power-up default settings. All other bits keep the factory settings listed in the register map. Changing the power-up default values is not recommended in production but for prototyping only.

The EEPROM of a device can only be programmed up to 1000 times. The number of programming cycles should never exceed this amount. Contact TI for changing production settings.

EEPROM values can only be changed if the input voltage (VIN_BIAS) is greater than 4.5 V. If the input voltage is less than 4.5 V, EEPROM values remain unchanged and the VPROG interrupt is issued. EEPROM programming requires less than 100 ms. During this time the supply voltage must be held constant and all I²C write commands are ignored. Completion of EEPROM programming is signaled by the EE_CMPL interrupt.

Figure 5-35. Flow Chart for Programming New Power-Up Default Values

NOTE

All re-programmed EEPROM settings must be validated during prototyping phase to ensure desired functionality because parts cannot be returned in case of incorrect programming. Any issues should be reported to the [e2e forum](#).

5.6 Register Maps

5.6.1 Password Protection

Registers 0x11h through 0x26h are protected against accidental write by a 8-bit password. The password must be written prior to writing to a protected register and automatically resets to 0x00h after the next I²C transaction, regardless of the register accessed or transaction type (read or write). The password is required for write access only and is not required for read access.

To write to a protected register:

1. Write the address of the destination register, XORed with the protection password (0x7Dh), to the PASSWORD register (0x10h).
2. Write the data to the password protected register.
3. If the content of the PASSWORD register XORed with the address send matches 0x7Dh, the data transfers to the protected register. Otherwise, the transaction is ignored. In either case the PASSWORD register resets to 0x00 after the transaction.

The cycle must be repeated for any other register that is Level1 write protected.

5.6.2 Freshness Seal (FSEAL) Bit

The FSEAL (freshness seal) bit prevents accidental shut-down of the always-on supplies, DCDC5 and DCDC6. The FSEAL bit exists in a default state of 0, and can be set to 1 and reset to 0 once for factory testing. The second time the bit is set to 1, it remains 1 and cannot reset again under software control. Coin-cell battery and main supply must be disconnected from the IC to reset the FSEAL bit again. With the FSEAL bit set to 1, DCDC5 and DCDC6 are forced ON regardless of the state of the DC5_EN and DC6_EN bit, and the rails do not turn off when the IC enters OFF mode.

A consecutive write of [0xB1, 0xFE, 0xA3] to the password register sets the FSEAL bit to 1. The three bytes must be written consecutively for the sequence to be valid. No other read or write transactions are allowed between the three bytes, or the sequence is invalid. After a valid sequence, the FSEAL bit in the STATUS register reflects the new setting.

After setting the FSEAL bit, the IC can enter OFF or any other mode of operation without affecting the state of the FSEAL bit, provided the coin-cell supply remains connected to the chip.

A second write of [0xB1, 0xFE, 0xA3] to the password register resets the FSEAL bit to 0. The three bytes must be written consecutively for the sequence to be valid.

A third write of [0xB1, 0xFE, 0xA3] to the password register sets the FSEAL bit to 1 and locks it into this state for as long as the coin-cell supply (CC) remains connected to the chip.

5.6.3 FLAG Register

The FLAG register contains a bit for each power rail and GPO to keep track of the enable state of the rails while the system is suspended. The following rules apply to the FLAG register:

- The power-up default value for any flag bit is 0.
- Flag bits are read-only and cannot be written to.
- Upon entering a SUSPEND state, the flag bits are set to same value as their corresponding ENABLE bits. Rails and GPOs enabled in a SUSPEND state have flag bits set to 1, while all other flag bits are set to 0. Flag bits are not updated while in the SUSPEND state or when exiting the SUSPEND state.
- The FLAG register is static in WAIT_PWR_EN and ACTIVE state. The FLAG register reflects the enable state of DCDC1, 2, 3, 4, LDO1, and GPO1, 2, 3 during the last SUSPEND state.

The host processor reads the FLAG register to determine if the system powered up from the OFF or SUSPEND state. In the SUSPEND state, typically the DDR memory is kept in self refresh mode and therefore the DC3_FLG or DC4_FLG bits are set.

5.6.4 TPS65218D0 Registers

Table 5-6 lists the memory-mapped registers for the TPS65218D0. All register offset addresses not listed in Table 5-6 should be considered as reserved locations and the register contents should not be modified.

Table 5-6. TPS65218D0 Registers

6 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

6.1 Application Information

The TPS65218D0 is designed to pair with various application processors. For detailed information on using TPS65218D0 with Sitara™ AM335x or Sitara AM437x processors, refer to [Powering the AM335x/AM437x with TPS65218](#). The typical application in [Section 6.2](#) is based on and uses terminology consistent with the Sitara™ family of processors.

6.1.1 Applications Without Backup Battery

In applications that require always-on supplies but no battery backup, the CC input to the power path must be connected to ground.

Figure 6-1. CC Input to Power Path

NOTE

In applications without backup battery, CC input must be tied to ground.

6.1.2 Applications Without Battery Backup Supplies

In applications that do not require always-on supplies, both inputs and the output of the power-path can simply be grounded. All pins related to DCDC5 and DCDC6 are also tied to ground, and PGOOD_BU and IN_nCC are kept floating. With the backup supplies completely disabled, the FSEAL bit in the STATUS register is undefined and should be ignored.

Figure 6-2. DCDC5 and DCDC6 Pins

NOTE

In applications that do not require always-on supplies, PGOOD_BU and IN_nCC can be kept floating. All other pins are tied to ground.

6.2 Typical Application

Figure 6-3. Typical Application Schematic

6.2.1 Design Requirements

Table 6-1 lists the design requirements.

Table 6-1. Design Parameters

	VOLTAGE	SEQUENCE
DCDC1	1.1 V	8
DCDC2	1.1 V	9
DCDC3	1.2 V	5
DCDC4	3.3 V	7
DCDC5	1.0 V	2
DCDC6	1.8 V	1
LDO1	1.8 V	3

6.2.2 Detailed Design Procedure

6.2.2.1 Output Filter Design

The step down converters (DCDC1, DCDC2, and DCDC3) on TPS65218D0 are designed to operate with effective inductance values in the range of 1 to 2.2 μH and with effective output capacitance in the range of 10 to 100 μF . The internal compensation is optimized to operate with an output filter of $L = 1.5 \mu\text{H}$ and $C_{\text{OUT}} = 10 \mu\text{F}$.

The buck boost converter (DCDC4) on TPS65218D0 is designed to operate with effective inductance values in the range of 1.2 to 2.2 μH . The internal compensation is optimized to operate with an output filter of $L = 1.5 \mu\text{H}$ and $C_{\text{OUT}} = 47 \mu\text{F}$.

The two battery backup converters (DCDC5 and DCDC6) are designed to operate with effective inductance values in the range of 4.7 to 22 μH . The internal compensation is optimized with an output filter of $L = 10 \mu\text{H}$ and $C_{\text{OUT}} = 20 \mu\text{F}$.

Larger or smaller inductor/capacitance values can be used to optimize performance of the device for specific operation conditions.

6.2.2.2 Inductor Selection for Buck Converters

The inductor value affects its peak to peak ripple current, the PWM to PFM transition point, the output voltage ripple, and the efficiency. The selected inductor must be rated for its DC resistance and saturation current. The inductor ripple current (ΔI_L) decreases with higher inductance and increases with higher V_{IN} or V_{OUT} . Equation 1 calculates the maximum inductor current ripple under static load conditions. The saturation current of the inductor should be rated higher than the maximum inductor current as calculated with Equation 2. This is recommended as during heavy load transient the inductor current will rise above the calculated value.

$$\Delta I_L = V_{\text{OUT}} \times \frac{1 - \frac{V_{\text{OUT}}}{V_{\text{IN}}}}{L \times f} \quad (1)$$

$$I_{L\text{max}} = I_{\text{OUTmax}} + \frac{\Delta I_L}{2}$$

where

- F = Switching frequency
- L = Inductor value
- ΔI_L = Peak-to-peak inductor ripple current
- $I_{L\text{max}}$ = Maximum inductor current

(2)

The following inductors have been used with the TPS65218D0 (see [Table 6-2](#)).

Table 6-2. List of Recommended Inductors

PART NUMBER	VALUE	SIZE (mm) [L × W × H]	MANUFACTURER
INDUCTORS FOR DCDC1, DCDC2, DCDC3, DCDC4

IHLP1212BZER1R5M11	1.5 μ H, 4.0 A, 28.5 m Ω	3.6 × 3.0 × 2.0	Vishay
INDUCTORS FOR DCDC5, DCDC6			
MLZ2012N100L	10 μ H, 110 mA, 300 m Ω	2012 / 0805 (2.00 × 1.25 × 1.25)	TDK
LQM21FN100M80	10 μ H, 100 mA, 300 m Ω	2012 / 0805 (2.00 × 1.25 × 1.25)	Murata

6.2.2.3 Output Capacitor Selection

The hysteretic PWM control scheme of the TPS65218D0 switching converters allows the use of tiny ceramic capacitors. Ceramic capacitors with low ESR values have the lowest output voltage ripple and are recommended. The output capacitor requires either an X7R or X5R dielectric.

At light load currents the converter operates in power save mode, and the output voltage ripple is dependent on the output capacitor value and the PFM peak inductor current. Higher output capacitor values minimize the voltage ripple in PFM Mode and tighten DC output accuracy in PFM mode.

The two battery backup converters (DCDC5 and DCDC6) always operate in PFM mode. For these converters, a capacitor of at least 20 μ F is recommended on the output to help minimize voltage ripple.

The buck-boost converter requires additional output capacitance to help maintain converter stability during high load conditions. At least 40 μ F of output capacitance is recommended and an additional 100-nF capacitor can be added to further filter output ripple at higher frequencies.

[Table 6-2](#) lists the recommended capacitors.

Table 6-3. List of Recommended Capacitors

PART NUMBER	VALUE	SIZE (mm) [L × W × H]	MANUFACTURER
CAPACITORS FOR VOLTAGES UP TO 5.5 V⁽¹⁾			
GRM188R60J105K	1 μ F	1608 / 0603 (1.6 × 0.8 × 0.8)	Murata

7 Power Supply Recommendations

The device is designed to operate with an input voltage supply range between 2.7 and 5.5 V. This input supply can be from a single cell Li-Ion battery or other externally regulated supply. If the input supply is located more than a few inches from the TPS65218D0 additional bulk capacitance may be required in addition to the ceramic bypass capacitors. An electrolytic capacitor with a value of 47 μF is a typical choice.

The coin cell back up input is designed to operate with a input voltage supply between 2.2 and 3.3 V This input should be supplied by a coin cell battery with 3-V nominal voltage.

8 Layout

8.1 Layout Guidelines

Follow these layout guidelines:

- The IN_X pins should be bypassed to ground with a low ESR ceramic bypass capacitor. The typical recommended bypass capacitance is 4.7- μF with a X5R or X7R dielectric.
- The optimum placement is closest to the IN_X pins of the device. Take care to minimize the loop area formed by the bypass capacitor connection, the IN_X pin, and the thermal pad of the device.
- The thermal pad should be tied to the PCB ground plane with a minimum of 25 vias. See [Figure 8-2](#) for an example.
- The LX trace should be kept on the PCB top layer and free of any vias.
- The FBX traces should be routed away from any potential noise source to avoid coupling.
- DCDC4 Output capacitance should be placed immediately at the DCDC4 pin. Excessive distance between the capacitance and DCDC4 pin may cause poor converter performance.

8.2 Layout Example

Figure 8-1. Layout Recommendation

Recommended Thermal Pad via size
 Hole size (s) = 8 mil
 Diameter (d) = 16 mil

Figure 8-2. Thermal Pad Layout Recommendation

9.3 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. In the upper right corner, click on *Alert me* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

9.4 Community Resources

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

TI E2E™ Online Community The TI engineer-to-engineer (E2E) community was created to foster collaboration among engineers. At e2e.ti.com, you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

Design Support *TI's Design Support* Quickly find helpful E2E forums along with design support tools and contact information for technical support.

9.5 Trademarks

PowerPAD, Sitara, E2E are trademarks of Texas Instruments.
Cortex is a trademark of ARM Ltd.
ARM is a registered trademark of ARM Ltd.

9.6 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

9.7 Glossary

[TI Glossary](#) This glossary lists and explains terms, acronyms, and definitions.

10 Mechanical, Packaging, and Orderable Information

The following pages include mechanical packaging and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TPS65218D0PHPR	ACTIVE	HTQFP	PHP	48	1000	RoHS & Green	NIPDAU	Level-3-260C-168 HR	-40 to 105	T65218D0	Samples
TPS65218D0PHPT	ACTIVE	HTQFP	PHP	48	250	RoHS & Green	NIPDAU	Level-3-260C-168 HR	-40 to 105	T65218D0	Samples
TPS65218D0RSLR	ACTIVE	VQFN	RSL	48	2500	RoHS & Green	NIPDAU	Level-3-260C-168 HR	-40 to 105	T65218D0	Samples
TPS65218D0RSLT	ACTIVE	VQFN	RSL	48	250	RoHS & Green	NIPDAU	Level-3-260C-168 HR	-40 to 105	T65218D0	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and

continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

PowerPAD™ PLASTIC QUAD FLATPACK

- NOTES:
- A. All linear dimensions are in millimeters.
 - B. This drawing is subject to change without notice.
 - C. Body dimensions do not include mold flash or protrusion
 - D. This package is designed to be soldered to a thermal pad on the board. Refer to Technical Brief, PowerPad Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 for information regarding recommended board layout. This document is available at www.ti.com <<http://www.ti.com>>.
 - E. Falls within JEDEC MS-026

PowerPAD is a trademark of Texas Instruments.

PHP (S-PQFP-G48)

PowerPAD™ PLASTIC QUAD FLATPACK

THERMAL INFORMATION

This PowerPAD™ package incorporates an exposed thermal pad that is designed to be attached to a printed circuit board (PCB). The thermal pad must be soldered directly to the PCB. After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For additional information on the PowerPAD package and how to take advantage of its heat dissipating abilities, refer to Technical Brief, PowerPAD Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 and Application Brief, PowerPAD Made Easy, Texas Instruments Literature No. SLMA004. Both documents are available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

Exposed Thermal Pad Dimensions

RSL (S-PVQFN-N48)

PLASTIC QUAD FLATPACK NO-LEAD

4207548/B 06/11

- NOTES:
- A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
 - B. This drawing is subject to change without notice.
 - C. Quad Flatpack, No-leads (QFN) package configuration.
 - D. The package thermal pad must be soldered to the board for thermal and mechanical performance.
 - E. See the additional figure in the Product Data Sheet for details regarding the exposed thermal pad features and dimensions.

RSL (S-PVQFN-N48)

PLASTIC QUAD FLATPACK NO-LEAD

THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

NOTE: All linear dimensions are in millimeters

RSL (S-PVQFN-N48)

PLASTIC QUAD FLATPACK NO-LEAD

- NOTES:
- A. All linear dimensions are in millimeters.
 - B. This drawing is subject to change without notice.
 - C. Publication IPC-7351 is recommended for alternate designs.
 - D. This package is designed to be soldered to a thermal pad on the board. Refer to Application Note, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at www.ti.com <<http://www.ti.com>>.
 - E. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC 7525 for stencil design considerations.
 - F. Customers should contact their board fabrication site for recommended solder mask tolerances and via tenting recommendations for vias placed in the thermal pad.
